<p><b>Disclaimers:</b> This Environmental Product Declaration (EPD) conforms to ISO 14025, 14040, ISO 14044, and ISO 21930.</p> <p><b>Scope of Results Reported:</b> The PCR requirements limit the scope of the LCA metrics such that the results exclude environmental and social performance benchmarks and thresholds, and exclude impacts from the depletion of natural resources, land use ecological impacts, ocean impacts related to greenhouse gas emissions, risks from hazardous wastes and impacts linked to hazardous chemical emissions.</p> <p><b>Accuracy of Results:</b> Due to PCR constraints, this EPD provides estimations of potential impacts that are inherently limited in terms of accuracy.</p> <p><b>Comparability:</b> The PCR this EPD was based on was not written to support comparative assertions. EPDs based on different PCRs, or different calculation models, may not be comparable. When attempting to compare EPDs or life cycle impacts of products from different companies, the user should be aware of the uncertainty in the final results, due to and not limited to, the practitioner's assumptions, the source of the data used in the study, and the specifics of the product modeled.</p> <p>Only EPDs prepared from cradle-to-grave life-cycle-assessment results and based on the same function, quantified by the same functional unit, and meeting all the conditions in ISO 14025, Section 6.7.2 can be used to assist purchasers and users in making informed comparisons between products.</p>	
PCR review, was conducted by	Tom Gloria, Ph.D., Industrial Ecology Consultants (Chair)
Approved Date: December 15, 2017 – End Date: December 14, 2022	
Independent verification of the declaration and data, according to ISO 14025:2006 and ISO 21930:2007	<input type="checkbox"/> internal <input checked="" type="checkbox"/> external

## ABOUT STANLEY® Access Technologies

STANLEY® Access Technologies is committed to being an industry leader in door automation through exceptional service, high quality product innovation, and lowest total cost of ownership. For over 80 years, we have been designing, building, installing and servicing manual and automatic sliding, swinging, revolving and folding doors as well as sensors and controls.

Everywhere you go, you can find our trusted products throughout a wide variety of commercial, institutional, industrial and transportation applications.

Headquartered in Farmington, CT, STANLEY® Access Technologies is the largest manufacturer, installer and service provider of automatic doors in North America.

## PRODUCT DESCRIPTION

The STANLEY Access *Dura-Glide™ 2000/3000 Automatic Sliding Doors* are manufactured in ISO 9001 certified facilities in Farmington, Connecticut and Greenfield, Indiana.

The *Dura-Glide 2000/3000* series durable automatic sliding doors consist of single or bi-parting assemblies which are built to order at Stanley's Farmington, CT or Greenfield, IN manufacturing facility. The individual door leaves slide behind swingout sidelites when the mechanism is activated or can slide on the exterior when the sidelites are fixed. The door is capable of being activated from one side only or both sides of the door depending on the installation requirements. Each sliding door leaf is suspended from a sliding hanger assembly mounted on a continuous aluminum header track for the full width of the door assembly. A tooth belt connects the sliding door leaves to the drive train. Each door leaf is suspended at its pivot stile by an adjustable cantilever support and pivot assembly which allows the leaf to swing out for emergency egress. The opening/closing mechanism is all electric/electronic. The door is always equipped with safety and activation devices complying to the applicable Codes and Standards.

## PRODUCT SPECIFICATION

**Table 1.** Product specifications for the STANLEY DuraGlide 2000/3000 Automatic Sliding Doors.

Parameter	Value	Option
Design	Single Slide or Bi-part	
Breakout	SX Panel on the 2000, SX and SO panels on the 3000	Wind Resistant Dampers reduce the potential for panel damage caused by wind gusts when panels are broken out, optional flush or surface mounted panic hardware.
Finish	Clear or Dark Bronze Anodized	Special Finishes Available
Typical Package Height	7'-8" (2.3 m), Clear Door Opening of 6'-11" (2.1 m)	Taller options available*
Typical Width Single Slide (narrow stiles)	7' to 9' (2.1 to 2.7 m), CDO width: 35 1/4" - 47 1/4" (896 mm - 1,201 mm)	
	2000 Emergency Breakout: 39" - 51" (991 mm - 1,296 mm)	
	3000 Emergency Breakout: 75" - 99" (1,905 mm - 2,515 mm)	
Typical Width Bi-part (narrow stiles)	10' to 14' (3.0 m - 4.3 m), CDO width: 48 1/4" - 72 1/4" (1,227 mm - 1,836 mm)	
	2000 Emergency Breakout: 55 1/2" - 79 1/2" (1,411 mm - 2,021 mm)	
	3000 Emergency Breakout: 105 1/2" - 153 1/2" (2,680 mm - 3,899 mm)	
Header Size	8" (203 mm) High x 6" (152 mm) Deep	
Jamb Dimension	1 3/4" x 4 1/2" (44.5 mm x 114 mm)	1 3/4" x 6" (44.5 mm x 152 mm)
Stiles	Narrow 2" (51 mm)	Medium 3 1/2" (89 mm)
Bottom Rail	4" (102 mm)	6" (152 mm), 8" (203 mm), 10" (254 mm), 12" (305 mm)
Typical Door Panel Weight	Up to 220 Pounds Each (100 kg)	Heavier options available*
Door Panel Materials	Aluminum	All Glass or Custom
Power Required	120 VAC, 50/60 HZ, 5 Amps Minimum	Uninterrupted Power Supply
Drive System	1/4 HP DC Motor, Gear Drive, Toothed belt	Twin 1/4 HP DC Motors
Controls	Rocker Switch	Rotary, Keyed Rotary Controls, Eco Pro
Controller	Microprocessor Based, Safety Logic	
Activation Sensors	2 SU-100 Motion	Activation sensors, Mats, Wall plates, Radio Control
Safety Sensors	1 Stan-Guard® and 2 Doorway Holding Beams	
Locking	Key/thumb turn hook bolt	3-Point Locking, Lock Position Indicators, Electric Solenoid Lock (Fail Safe/Fail Secure), Access Control Locking with Surface or Recessed Panic Hardware, Lock Guard, Armored Strike
Security Options	Alarm contacts for remote monitoring of panel status, Security Strobes, Delayed Egress	
Camera Options	Jamb Camera, Stan-Cam	
Temperature Rating	-30F (34C) to 130F (54C)	
Glass Stops	1/4" (6.35 mm)	1/2" (12.7 mm), 5/8" (15.9 mm), 1" (25.4 mm)
Muntin	One 2" (50.8 mm) muntin	4 1/4" (108 mm), Multiple
Threshold	Configurable	
Transom	Configurable Verticals and/or Horizontals	
Speed Range	Closing Speeds 0.5' - 1.5 per sec per ANSI. Opening Speeds 0.5' - 2.5' per sec.	
Codes and Standards	UL, cUL, ANSI/BHMA A156.10, IBC, UBC, BOCA, ICBO, NFPA 101, CSFM	

## MATERIAL RESOURCES

The material composition and availability of raw material resources of the Dura-Glide™ 2000/3000 Automatic Sliding Doors are shown in Table 2. Information on product packaging is shown in Table 3.

**Table 2.** Material composition of the STANLEY Access Dura-Glide™ 2000/3000 Automatic Sliding Doors.

Component	Material	Availability				Dura-Glide™ 2000/3000	
		Renewable	Non-Renewable	Recycled (% pre-/post-consumer)	Origin of Materials	(kg/m <sup>2</sup> )	(%)
Recycled Aluminum	Aluminum	Mineral, Abundant		30%/40%	North America	6.1	37%
Aluminum	Aluminum	Mineral, Abundant		0%	Global	7.4	45%
Steel	Steel	Mineral, Abundant		0%	Global	2.4	14%

## ADDITIONAL ENVIRONMENTAL INFORMATION

STANLEY® Access Technologies is the only automatic door manufacturer with two US manufacturing facilities; Indianapolis, IN and Farmington, CT.

Stanley's Refurbish Equipment Program means no dumpsters required and no landfills used; oil and grease is recycled.

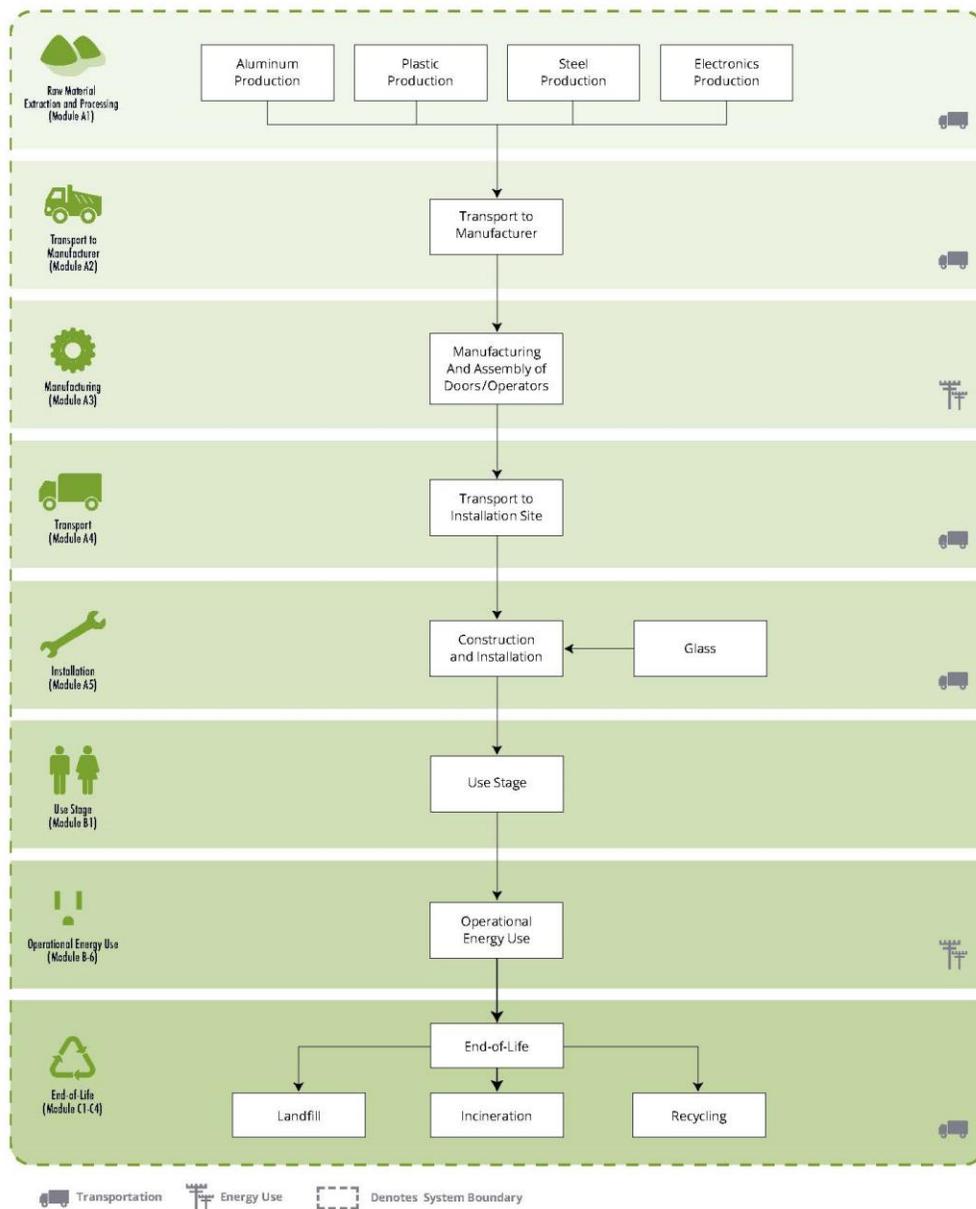

Our Plant Recycling Program recycles oil and grease, cardboard, white paper and scrap aluminum and steel.

In 2017, STANLEY® Access Technologies' Farmington factory installed a combustion-free Bloom Energy Server for clean energy. This server will deliver enhanced sustainability benefits including high efficiency greenhouse gas emissions, avoid air pollutants and significantly reduce water use.

Our aluminum vendors are ISO14001 and ISO 50001 certified to control their energy usage and environmental impacts.

## PROCESS FLOW DIAGRAM

The diagram below is a representation of the most significant contributions to the life cycle of the STANLEY Access *Dura-Glide™ 2000/3000 Automatic Sliding Doors*. The following life cycle stages are included: production (Modules A1-A3); construction & installation (Module A4-A5); product use (Modules B1, B6, and B7); and end-of-life (Modules C1-C4).

## LIFE CYCLE ASSESSMENT OVERVIEW

The system boundary is cradle-to-gate with options and includes resource extraction and processing, product manufacture and assembly, distribution/transport, use, and end-of-life. The diagram below illustrates the life cycle stages included in this EPD.

Product			Construction Process		Use							End-of-Life			
A1	A2	A3	A4	A5	B1	B2	B3	B4	B5	B6	B7	C1	C2	C3	C4
Raw Material Extraction and Processing	Transport to the Manufacturer	Manufacturing	Transport	Construction - Installation	Use	Maintenance	Repair	Replacement	Refurbishment	Operational energy use	Operational water use	Deconstruction demolition	Transport	Waste processing	Disposal
X	X	X	X	X	X	MND	MND	MND	MND	X	X	X	X	X	X

X = Included

MND = Module Not Declared

The following provides a brief overview of the Modules included in the product system for the STANLEY Access Dura-Glide™ 2000/3000 Automatic Doors.

### Module A1: Raw material extraction and processing

This module includes the potential environmental impacts associated with the extraction and processing of raw materials for various component parts in the door products. The primary components are fabricated of aluminum and steel. The impacts from fabrication processes were based on representative datasets for metal product manufacturing.

### Module A2: Transportation

This module includes transportation of processed raw materials and product components to the STANLEY manufacturing facilities in Connecticut and Indiana.

### Module A3: Manufacture of the Door Products

This stage includes all the relevant manufacturing processes and flows, including the impacts from energy use and emissions at the facility. Production of capital goods, infrastructure, manufacturing equipment, and personnel-related activities are not included. This stage also includes the production and disposal (including transport) of the product packaging materials.

### Module A4: Transportation & Delivery to the Installation Site

This module includes the impacts associated with delivery of door product to the installation site.

**Module A5: Construction & Installation**

This module includes installation of the products.

**Module B1: Normal use of the product**

This module includes environmental impacts arising through normal anticipated use of the product. Energy use is accounted for in Module B6: Operational Energy Use.

**Module B2: Maintenance**

This module considers the impacts associated with cleaning and maintenance of the product over the product Reference Service Life (RSL).

*Module Not Declared.*

**Module B3: Repair**

This module includes any anticipated repair events during the reference service life of the automatic doors.

*Module Not Declared.*

**Module B4-B5: Replacement and Refurbishment**

These modules include anticipated replacement or refurbishment events during the reference service life associated with replacing a whole product (Module B4) and restoration of parts to a condition in which the products can perform its required function (Module B5).

*Modules Not Declared.*

**Module B6: Operational Energy Use**

This module includes the primary energy consumption (electricity) associated with the operational use of these products. Operational energy use is estimated by the manufacturer as 121 kWh/yr based on the power rating of the product and assumed frequency of use.

**Module B7: Operational Water Use**

No water use occurs during the operation of the product and impacts are zero.

**Module C1-C4: End-of-Life**

The end-of-life stage of the product starts when it is replaced, dismantled or deconstructed from the building. Impacts for deconstruction and dismantling processes were not modeled in the LCA as it is a manual process with hand tools, and does not require any energy input for removal of the product. The impacts associated with transportation of waste materials to processing facilities, waste processing of material components and waste disposal of the product are included in these modules.

## LIFE CYCLE IMPACT ASSESSMENT

Impact category indicators are calculated using the TRACI 2.1 and CML-IA characterization methods. TRACI 2.1 impact category indicators include global warming potential (100 years), acidification potential, smog potential, ozone depletion potential, and eutrophication potential. CML-IA impact category indicators include global warming potential (100 years), acidification potential, eutrophication potential, Photochemical Ozone Creation potential, ozone depletion potential, and abiotic resource depletion, in accordance with the PCR. The LCIA results are calculated using SimaPro 8.3 software. The results for these indicators are shown in Table 3.

**Table 4.** Results for 10 years of use of the STANLEY Access Dura-Glide™ 2000/3000 Power-Operated Door.

Impact Category	Total	Production			Construction & Installation	Use	End-of-Life
		A1	A2	A3	A4-A5	B1, B6, B7	C1-C4

## ADDITIONAL ENVIRONMENTAL PARAMETERS

ISO 21930 requires that several parameters be reported in the EPD, including resource use, waste categories and output flows, and other environmental information. The results for these parameters are shown in Table 5.

**Table 5.** Results for 10 years of use of the STANLEY door product by module. Results representing energy flows are calculated using lower heating (i.e., net calorific) values.

Impact Category	Total	Production			Construction & Installation	Use	End-of-Life
		A1	A2	A3	A4-A5	B1, B6, B7	C1-C4

## Data Quality

Data Quality Parameter	Data Quality Discussion
<b>Time-Related Coverage</b> Age of data and the minimum length of time over which data should be collected	The most recent available data are used, based on other considerations such as data quality and similarity to the actual operations. Typically, these data are less than 10 years old (typically 2016). All of the data used represented an average of at least one year's worth of data collection, and up to three years in some cases. Manufacturer-supplied data (primary data) are based on annualized production for 2016.
<b>Geographical Coverage</b> Geographical area from which data for unit processes should be collected to satisfy the goal of the study	The data used in the analysis provide the best possible representation available with current data. Electricity use for product manufacture is modeled using representative data for the appropriate eGRID and Canadian electricity grid mixes. Surrogate data used in the assessment are representative of North American or global operations. Data representative of global operations are considered sufficiently similar to actual processes. Data representing product disposal are based on US statistics.
<b>Technology Coverage</b> Specific technology or technology mix	For the most part, data are representative of the actual technologies used for processing, transportation, and manufacturing operations. Representative datasets are used to represent the actual processes, as appropriate.
<b>Precision</b> Measure of the variability of the data values for each data expressed (e.g. variance)	Precision of results are not quantified due to a lack of data. Data collected for operations were typically averaged for one or more years and over multiple operations, which is expected to reduce the variability of results.
<b>Completeness</b> Percentage of flow that is measured or estimated	The LCA model included all known mass and energy flows for production of the door products. In some instances, surrogate data used to represent upstream and downstream operations may be missing some data which is propagated in the model. No known processes or activities contributing to more than 1% of the total environmental impact for each indicator are excluded. In total, these missing data represent less than 5% of the mass or energy flows.
<b>Representativeness</b> Qualitative assessment of the degree to which the data set reflects the true population of interest (i.e. geographical coverage, time period, and technology coverage)	Data used in the assessment represent typical or average processes as currently reported from multiple data sources, and are therefore generally representative of the range of actual processes and technologies for production of these materials. Considerable deviation may exist among actual processes on a site-specific basis; however, such a determination would require detailed data collection throughout the supply chain back to resource extraction.
<b>Consistency</b> Qualitative assessment of whether the study methodology is applied uniformly to the various components of the analysis	The consistency of the assessment is considered to be high. Data sources of similar quality and age are used; with a bias towards Ecoinvent v3.3 data where available. Different portions of the product life cycle are equally considered; however, it must be noted that final disposition of the product is based on assumptions of current average practices in the United States.
<b>Reproducibility</b> Qualitative assessment of the extent to which information about the methodology and data values would allow an independent practitioner to reproduce the results reported in the study	Based on the description of data and assumptions used, this assessment would be reproducible by other practitioners. All assumptions, models, and data sources are documented.
<b>Sources of the Data</b> Description of all primary and secondary data sources	Data representing energy use at STANLEY's manufacturing facilities represent an annual average and are considered of high quality due to the length of time over which these data are collected, as compared to a snapshot that may not accurately reflect fluctuations in production. For secondary LCI datasets, Ecoinvent v2.2 and v3.3 LCI data are used, with a bias towards Ecoinvent v3.3 data.
